

Several millions of malignant cells are being destroyed daily with the help of Flavin 7

We are getting even with cancer

Preventing and stopping malignant tumors has been increasingly coming into the limelight. Fortunately, a fruit concentrate was developed by a research laboratory in Eger two years ago, which was then developed further using seed extracts of fruits. The agent prevents the development of cancer on a genetic level and helps to destroy diseased cells. Today, Flavin 7 is the prophylactic drink of several thousands of people.

“Everyone becomes frightened when it turns out that they suffer from some kind of disease. People try to fight the developed problem, although, unfortunately very few really think about it: how much easier it would be if we did not wait for our health to get in danger. Since when there is no problem, it does not even arise in most of the people that for the preservation of our most valuable treasure, our health, we have to take action on a daily basis. And prevention is the most obvious step we can take for our own good.” – explains Laszlo Szabo, the developer of the Flavin 7 prophylactic drink. The teacher from Eger has always been astounded by what a great strength lies in nature, and firmly believes that the key to our health is hidden in our natural sources.

His father’s infarct and a halt in his blood formation urged Laszlo Szabo to do research, like this he became engaged in dealing with flavonoids, the compound groups that slow down the cellular aging process. As a result of his work was born the fruit concentrate – today known as Flavin 7 – that contains flavonoids, antioxidants, antocianidins and vegetable immune substance. The product developed by Laszlo Szabo not only provides help in case of an already existent sickness, but in something that is at least as equally important: plays a great role in prevention. Millions of cells are produced and die in our systems daily. Depending on our lifestyles, to what environmental effects we are exposed to, a mistake can be made during cell generation, which can result in the formation of malignant cells. Fortunately the human system is a great invention, since we have the so-called repair genes with a task to neutralize these defective, malignant cells. If too many of them is produced then it is not certain that our system can fight them off, and the malignant cells can cause the formation of a tumor. Although our bodies fight against the development of malignant cells every day, only the healthy body is able to defend itself, and even then there is a chance of the development of cancer. Since nobody develops a tumor overnight, with the help of the prophylactic drink we can daily prevent the survival of defective cells, the development of cancer, of tumors, on a genetic level.

News spread fast about the fruit concentrate, and then professor Dr. Istvan Ember, the director of the Medical People’s Health Institution of the General Medical Faculty of the University of Pecs, met Laszlo Szabo at a cancer research scientific conference. Istvan Ember has been researching and testing those substances that help our systems in prevention against diseases. He tested very many substances during his experimentation with animals. Laszlo Szabo’s concentrate and Istvan Ember’s experiments created a

mutual interest, laboratory tests and various experiments followed. Even the very first experiment had an unbelievable result. Istvan Ember injected the strongest cancerous substance, DMBA, into rats and mice. He gave some of Flavin 7 once to the little animals and gave them DMBA every day. He drew blood from them on the first, second, and third days, and the examination revealed, that even the strongest cancer-causing agent did not cause tumors in those animals that received the prophylactic substance. During the next experiment the professor was curious to see what happens if he gives the concentrate to non-healthy animals. This time he implanted various types of deadly tumors into the rodents' bodies. He did not give any medicinal agent to the first group, therefore those died in two to three weeks. The second group in the experiment was continually supplied with the fruit concentrate, resulting in slower tumor growth and the mice lived five times longer. Therefore, either used as a preventative agent, or used as a treatment, the experiments unambiguously showed the exceptional effects of the fruit concentrate.

Since in case of every sickness, the earlier it is diagnosed the easier it is to treat it, Laszlo Szabo needed such a method of examination, during which cancer can be diagnosed the earliest possible and with the greatest certainty. This is how he found professor Dr. Janos Mink, head of the Structural Research Department and the Molecule-spectroscopic Division of the Chemistry Research Center of the Hungarian Academy of Sciences. Janos Mink is the originator of the worldwide unique skin and hair diagnostic method. The essence of the method developed by the professor is, that it is possible to diagnose any change in the individual's general biological picture and to see if the individual is exposed to any health hazards. The amount of toxic substance built up in our bodies can be measured from the toxic substance present in our hair and skin, for example the methyl content. However, for all this there is no need for any painful sample taking, only for a couple of hairs. There is no need for lengthy pre-examinations either. Furthermore, the method's other big virtue besides its quickness is that it supplies the doctor with way more information than any other examination method. Naturally, Janos Mink tested the skin and hair diagnostic method. Three years ago he examined 25 patients' hairs, of whom health status he had no previous knowledge of. According to the experiment he examined the hair samples taken from five healthy people and 25 others suffering from breast cancer, and the professor was mistaken only once. Also, in 2002, he was sent 50 Peruvian miners' hairs for examination, and he called attention to sicknesses in 18 cases. Following this, 17 of the 50 miners, sent to a Peruvian doctor, were diagnosed with a serious sickness.

So the *Great Trio* has been formed: Laszlo Szabo, Istvan Ember, and Janos Mink now fight in unison for the goal that was also important for them individually. They became not only colleagues and friends but also allies, since they have started a war against the deadly disease cancer. Their tools are the skin and hair examination, assessment of the function of genes, and the daily consumption of the fruit concentrate, which qualifies as a meal supplement and is available for all at pharmacies.
